FORM PTO-1390 (Modified) (REV 11-98) U.S. DEPARTMENT OF COMMERCE PATENT AND TRADEMARK OFFICE

TRANSMITTAL LETTER TO THE UNITED STATES DESIGNATED/ELECTED OFFICE (DO/EO/US) CONCERNING A FILING UNDER 35 U.S.C. 371

ATTORNEY'S DOCKET NUMBER	U.S. APPLICATION NO. (IF KNOWN, SEE 37 CFR)
A33606-PCT USA	09/647965

INTERNATIONAL APPLICATION NO.	INTERNATIONAL FILING DATE	PRIORITY DATE CLAIMED
PCT/CA99/00314	07 April 1999	07 April 1998

TITLE OF INVENTION

HIGHLY ACTIVE FORMS OF INTERFERON REGULATORY FACTOR PROTEINS

APPLICANT(S) FOR DO/EO/US

HISCOTT, John and LIN, Rongtuan

Applicant herewith submits to the United States Designated/Elected Office (DO/EO/US) the following items and other information:

1. ☒ This is a **FIRST** submission of items concerning a filing under 35 U.S.C. 371.
2. ☐ This is a **SECOND** or **SUBSEQUENT** submission of items concerning a filing under 35 U.S.C. 371.
3. ☒ This is an express request to begin national examination procedures (35 U.S.C. 371(f)) at any time rather than delay examination until the expiration of the applicable time limit set in 35 U.S.C. 371(b) and PCT Articles 22 and 39(1).
4. ☒ A proper Demand for International Preliminary Examination was made by the 19th month from the earliest claimed priority date.
5. ☒ A copy of the International Application as filed (35 U.S.C. 371 (c) (2))
   a. ☒ is transmitted herewith (required only if not transmitted by the International Bureau).
   b. ☐ has been transmitted by the International Bureau.
   c. ☐ is not required, as the application was filed in the United States Receiving Office (RO/US).
6. ☐ A translation of the International Application into English (35 U.S.C. 371(c)(2)).
7. ☐ A copy of the International Search Report (PCT/ISA/210).
8. ☒ Amendments to the claims of the International Application under PCT Article 19 (35 U.S.C. 371 (c)(3))
   a. ☐ are transmitted herewith (required only if not transmitted by the International Bureau).
   b. ☐ have been transmitted by the International Bureau.
   c. ☐ have not been made; however, the time limit for making such amendments has NOT expired.
   d. ☒ have not been made and will not be made.
9. ☐ A translation of the amendments to the claims under PCT Article 19 (35 U.S.C. 371(c)(3)).
10. ☐ An oath or declaration of the inventor(s) (35 U.S.C. 371 (c)(4)).
11. ☒ A copy of the International Preliminary Examination Report (PCT/IPEA/409).
12. ☐ A translation of the annexes to the International Preliminary Examination Report under PCT Article 36 (35 U.S.C. 371 (c)(5)).

Items 13 to 20 below concern document(s) or information included:

13. ☐ An Information Disclosure Statement under 37 CFR 1.97 and 1.98.
14. ☐ An assignment document for recording. A separate cover sheet in compliance with 37 CFR 3.28 and 3.31 is included.
15. ☒ A **FIRST** preliminary amendment.
16. ☐ A **SECOND** or **SUBSEQUENT** preliminary amendment.
17. ☐ A substitute specification.
18. ☐ A change of power of attorney and/or address letter.
19. ☒ Certificate of Mailing by Express Mail
20. ☒ Other items or information:

A postcard.

Express Mail No. : EK839862405US

HIGHLY ACTIVE FORMS OF INTERFERON REGULATORY FACTOR PROTEINS

BACKGROUND OF THE INVENTION

Interferons (IFNs) are a large family of multifunctional secreted proteins involved in antiviral defence, cell growth regulation and immune activation (63). Virus infection induces the transcription and synthesis of multiple IFN genes (33,52,63); newly synthesized IFN interacts with neighbouring cells through cell surface receptors and the JAK-STAT signalling pathway, resulting in the induction of over 30 new cellular proteins that mediate the diverse functions of the IFNs (17,35,39,58). Among the many virus- and IFN-inducible proteins are the growing family of IRF transcription factors, the Interferon Regulatory Factors (IRFs).

IRF-1 and IRF-2 are the best characterized members of this family, originally identified by studies of the transcriptional regulation of the human IFN-β gene (22,23,30,47). Their discovery preceded the recent expansion of this group of IFN-responsive proteins which now include seven other members: IRF-3, IRF-4/Pip/ICSAT, IRF-5, IRF-6, IRF-7, ISGF3γ/p48 and ICSBP (48). Structurally, the Myb oncoproteins share homology with the IRF family, although its relationship to the IFN system is unclear (62). Recent evidence also demonstrates the presence of virally encoded analogue of cellular IRFs - vIRF in the genome of human herpes virus 8 (HHV8) (55).

The presence of IRF-like binding sites in the promoter region of the IFNA and IFNB genes implicated the IRF factors as essential mediators of the induction of IFN genes. The original results of Harada et al. (30,32) indicated that IFN gene induction was activated by IRF-1, while the related IRF-2 factor suppressed IFN expression. However, the essential role of IRF-1 and IRF-2 in the regulation of IFNA and IFNB gene expression has become controversial with the observation that mice containing homozygous deletion of IRF-1 or IRF-2, or fibroblasts derived from these mice, induced IFNA and IFNB gene

expression after virus infection to the same level as the wild-type mice or cells (44).

On the other hand, IRF-1 was shown to have an important role in the antiviral effects of IFNs (44,54). IRF-1 binds to the ISRE element present in many IFN-inducible gene promoters and activates expression of some of these genes (54). However, activation of ISG genes by IFNA and IFNB was shown to be mediated generally by the multiprotein ISGF3 complex (31,36,38). The binding of this complex to DNA is mediated by another member of the IRF family, ISGF3γ/p48, which in IFN-treated cells interacts with phosphorylated STAT1 and STAT2 transcription factors forming the heterotrimeric complex ISGF3 (8,39,62). The homozygous deletion of p48 in mice abolished the sensitivity of these mice to the antiviral effects of IFNs, and virus-infected macrophages from p48-/- mice showed an impaired induction of IFNA and IFNB genes (31).

Several other members of the IRF family have been identified. The ICSBP gene is expressed exclusively in the cells of the immune system (18,64) and its expression can be enhanced by IFNγ. ICSBP was shown to form a complex with IRF-1 and inhibit the transactivating activity of IRF-1 (9,59). The homozygous deletion of ICSBP in mice leads to defects in myeloid cell lineage development and chronic myelogous leukemia (34). Another lymphoid specific Pip/LSIRF/IRF-4 was identified (19,43,66) that interacts with phosphorylated PU.1, a member of the Ets family of transcription factors (15). The Pip/PU.1 heterodimer can bind to the immunoglobulin light chain enhancer and function as a B cell specific transcriptional activator. Expression of Pip/LSIRF was induced by antigenic stimulation but not by IFN, and Pip/LSIRF/IRF-4 -/- mice failed to develop mature T and B cells (46). A novel member of the IRF family was recently identified by its ability to bind to an ISRE-like element in the promoter region of the Qp gene of EBV (69).

Another unique member of the human IRF family, IRF-3 was characterized recently (2). The IRF-3 gene encodes a 55-kDa protein which is expressed constitutively in all tissues. IRF-3 was originally identified as a member of the

IRF family based on homology with other IRF family members and on binding to the ISRE of the ISG15 promoter. The relative levels of IRF-3 mRNA do not change in virus-infected or IFN-treated cells. Recombinant IRF-3 binds to the ISRE element of the IFN-induced gene ISG-15 and stimulates this promoter in transient expression assays. In previous studies, it has been shown that IRF-3 binds to the IE and PRDIII regions of the IFNA and IFNB promoters respectively, but has different effects on their transcriptional activity (56). While the induction of the IFNA4 promoter activated by IRF-1 or virus infection was inhibited in the presence of IRF-3, the fusion protein containing the IRF-3 DNA binding domain and the RelA(p65) transactivation domain effectively activated both IFNA and IFNB promoters. In contrast, co-expression of IRF-3 and RelA plasmids transactivated the IFNB gene promoter, but not the promoter of the IFNA4 gene (56).

Most of the IRF family members so far identified appear to have specific and critical functions in lymphoid cells and/or their action is related to the signalling pathway induced by IFN or viruses. Interestingly, there is recent evidence indicating that the IRF(s) may also play a role in the transcriptional activation of viral promoters. The Qp promoter region of the EBV-encoded gene EBNA-1 contains an ISRE-like element that is responsive to the IRF-1 and IRF-2 as well as to IFN-α. Using a yeast one-hybrid screen technique, a new factor was recently isolated that binds specifically to the Qp ISRE. The amino acid sequence of this protein is identical to the IRF-7 protein present in the Genbank database ((69); accession number U73036). By homology search of the HGF ETS cDNA library the Pitha group has also identified a novel IRF whose sequence is identical to that of IRF-7. At the amino acid level, IRF-7 shows highest homology to IRF-3. Several open reading frames (ORFs) of IRF-7 have been identified. Pagano's group found three shorter ORFs, listed in the database as IRF-7A, B and C ((69), accession nos. U53830, U53831 and U53832, respectively). A new IRF-7 isoform, IRF-7H, was recently identified by Pitha's group ((70), accession number AF076494).

In vitro translated IRF-7 encodes a protein of 68 kDa (69, 72). Interestingly, while *in vitro* translated IRF-7 protein binds effectively to the Qp ISRE, it doesn't seem to affect transcription of Qp-driven reporter constructs in a transient transcription assay (72). In contrast to IRF-3, IRF-7 expression is not generally constitutive but can be effectively induced by IFN-α in fibroblast cells, B-cells and other cells of lymphoid origin (70, 71). Like IRF-3, in uninfected cells, IRF-3 is present mainly in the cytoplasm, virus infection induced phosphorylation of IRF-7, resulting in cytoplasmic to nuclear translocation of phosphorylated IRF-7 and activated gene transcription (70, 71). Recent studies indicate that virus-stimulated phosphorylation of IRF-3 results in the activation of IFNα4 and IFNβ gene transcription in murine cells. Once produced and secreted from the infected cell, IFNα4 and IFNβ subsequently feed back on cells through the IFN receptor, stimulate the Jak-STAT pathway and lead to the IFN-responsive activation of another member of the IRF family - IRF-7; up-regulation of IRF-7 production then mediates the induction of non-IFNα4 gene expression (71).

SUMMARY OF THE INVENTION

The present invention relates to IRF proteins that have been modified in the carboxy-terminus domain (transactivation domain)by modification of serine and/or threonine sites. Modification may be achieved by phosphorylation of serine and/or threonine, or by replacement of serine and/or threonine residues with residues having acidic side-chains, preferably carboxylic acid-containing side-chains, such as aspartic acid or glutamic acid residues. Such modified proteins may be mutants of IRF-3 and IRF-7, including chimeric proteins having portions of both IRF-3 and IRF-7, and post-translationally modified (phosphorylated) IRF-3 protein, the phosphorylation being induced by Sendai virus infection.

More specifically, the present invention provides a modified interferon regulatory factor (IRF) protein, the protein comprising at least one modified serine or threonine

phosphoacceptor site in the carboxy-terminus domain, preferably wherein cytokine gene activation by the modified IRF is increased relative to cytokine gene activation by a corresponding wild type IRF protein.

The present invention also provides nucleotide sequences which encode a protein of the invention as described above. Such nucleotide sequences may, for example, be used to modify a target cell of an organism.

The present invention also provides a pharmaceutical composition comprising an effective amount of the interferon regulatory factor (IRF) protein according to the invention, together with a pharmaceutically acceptable carrier, for the treatment of a viral infection, for example, an influenza infection, a herpes infection, a hepatitis infection or an HIV infection.

The present invention also provides a commercial package containing the IRF protein or pharmaceutical composition according to the invention, together with instructions for its use for the treatment of cancer or of a viral infection, for example, an influenza infection, a herpes infection, a hepatitis infection or an HIV infection.

The present invention further provides use of the interferon regulatory factor (IRF) protein according to the invention to activate a cytokine gene, preferably wherein the cytokine gene is an interferon gene or a chemokine gene.

DESCRIPTION OF THE FIGURES

Figure 1. Sendai virus infection induces IRF-3 degradation. IRF-3 expression plasmid CMVBL-IRF3 (lanes 1 and 2) or CMVBL vector alone (lanes 3 and 4), both at 5 µg were transiently transfected into 293 cells by the calcium

phosphate method. At 24h post transfection, cells were infected with Sendai virus for 16h (lanes 2 and 4) or left uninfected (lanes 1 and 3). Whole cell extracts (20 µg) were prepared and analyzed by immunoblotting with anti-IRF-3 antibody.

Figure 2. Sendai virus induced phosphorylation and degradation of IRF-3 protein. A) rtTA-IRF-3 cells, selected as described in Example, were induced to express IRF-3 by doxycycline treatment for 24h. At 24h after Dox addition, cells were infected with Sendai virus for 4, 8, 12, 16, 20, or 24h (lanes 2-7) or were left uninfected (lane 1). IRF-3 protein was detected in whole cell extracts (10 µg) by immunoblot. Two forms of IRF-3 were detected, designated as form I and form II. B) At 24h post Dox induction, rtTA-IRF-3 cells were infected with Sendai virus for 16 hours (lanes 4-8) or were left uninfected (lanes 1-3). Whole cell extracts from untreated

cells (20 μg) or Sendai virus infected cells (60 μg) were incubated with 0.3 units of potato acidic phosphatase (PPA, lanes 2, 3, 7 and 8) or 5 units of calf intestinal alkaline phosphatase (CIP, lanes 4 and 5) in the absence (lanes 1, 2, 4, 6 and 7) or presence of phosphatase inhibitors (lanes 3, 5 and 8). Phosphorylated IRF-3 protein appears as a distinct band in immunoblots, migrating more slowly than IRF-3 forms I and II.

Figure 3. Analysis of IRF-3 deletion mutants in Sendai virus induced phosphorylation.

(A) Schematic representation of four IRF-3 deletions. Thick solid lines and thin dashed lines indicate included and excluded sequences, respectively. The N-terminal IRF homology domain, the nuclear export signal (NES) and C-terminal IRF association domain are indicated.

(B) Expression plasmids (5 μg each) encoding wild type and deletion mutants of IRF-3 (as indicated above the lanes) were transiently transfected into 293 cells; at 24h post transfection, cells were infected with Sendai virus for 16h (lanes 2, 4, 6, 8, and 10) or left uninfected (lanes 1, 3, 5, 7, and 9). Whole cell extracts (20 μg) were prepared from infected and control cells and analyzed by immunoblotting for IRF-3 forms I and II and for the presence of phosphorylated IRF-3 (P-IRF-3) with anti-IRF-3 antibody.

Figure 4. Analysis of IRF-3 point mutations in Sendai virus induced phosphorylation.

(A) Schematic representation of IRF-3 point mutations. Thick solid lines and thin dashed lines indicate included and excluded sequences, respectively. The N-terminal IRF homology domain, the Nes element and C-terminal IRF association domain are indicated. Amino acids residues from 382 to 414 and from 141 to 147 are shown. The amino acids targeted for alanine or aspartic acid substitution are shown in large print. The point mutations are indicated below the sequence: (2A: S396A/S398A; 3A: S402A/T404A/S405A; 5A: S396A/S398A/S402A/T404A/S405A); 5D S396D/S398D/S402D/T404D/S405D; J2A: S385A/S386A; NES: S145A/S146A).

(B) Expression plasmids (5 μg each) encoding wild type and

point mutants of IRF-3 (as indicated above the lanes) were transiently transfected into 293 cells; at 24h post transfection, cells were infected with Sendai virus for 16h (lanes 2, 4, 6, 8, 10, 12, 14, 16 and 18) or left uninfected (lanes 1, 3, 5, 7, 9, 11, 13, 15 and 17). Whole cell extracts (20 μg) were prepared from infected and control cells and analyzed by immunoblotting for IRF-3 forms I and II and for the presence of phosphorylated IRF-3 (P-IRF-3) with anti-IRF-3 antibody.

Figure 5. Virus dependent cytoplasmic-nuclear translocation of IRF-3.

The subcellular localization of the GFP-IRF-3 (A and B), GFP-IRF-3(5A) (C and D), GFP-IRF-3(5D) (E and F) and GFP-IRF-3(NES) (G and H) was analyzed in uninfected (A, C, E, and G) and Sendai virus infected COS-7 cells at 16h after infection. GFP fluorescence was analyzed in living cells with a Leica fluorescence microscope using 40x objective.

Figure 6. Transactivation of PRDI/PRDIII and ISRE containing promoters by IRF-3.

293 cells were transfected with IFNβ-CAT (A and B) or ISG15-CAT (C) reporter plasmids and the various expression plasmids as indicated below the bar graph. CAT activity was analyzed at 48h post-transfection with 100 μg (IFNβ-CAT) or 10 μg (ISG15-CAT) of total protein extract for 1-2h at 37°C. Relative CAT activity was measured as fold activation (relative to the basal level of reporter gene in the presence of CMV-Bl vector alone after normalization with co-transfected β-Gal activity); the values represent the average of three experiments with variability shown in the error bar.

Figure 7. IRF-3 inducible expression of RANTES gene.

(A) Stimulation of RANTES gene transcription in virus-infected and IRF-3(5D)-expressing cells. The rtTA, IRF-3 and IRF-3(5D) cells were cultured in the presence or absence of Dox as indicated. After 30 hours, cells were either left untreated, infected with Sendai virus (80HAU/ml) for 16 hours, or treated with IFN-α/β (100 IU/ml). The neutralizing antibody for type I IFN (Sigma) was added at the time of Dox addition.

Total RNA was isolated from each sample and analyzed by RPA using the hCK5 kit (Pharmingen).

(B) Repression of virus-induced RANTES gene transcription by a dominant-negative form of IRF-3. The rtTA- and IRF-3(ΔN)-expressing cells were either left untrated or infected with Sendai virus (80 HAU/ml) for 16 hours. Total RNA was isolated from each sample and analyzed by RPA.

(C) The kinetics of RANTES expression induced by IRF-3 (5D). Total RNA from IRF-3(5D)-expressing cells was isolated from each sample after Dox addition and analyzed by RPA.

(D) Cell culture supernatants were analyzed for the presence of RANTES protein by an ELISA performed as specified by the manufacturer (Biosource International).

Figure 8. Stabilization of IRF-3 by proteasome inhibitors.

IRF-3 ΔN (Δ9-133) (B) or IRF-3 ΔN2A (C) expression plasmids were transiently transfected into 293 cells; at 24h post transfection, cells were infected with Sendai virus and treated for 12h with calpain inhibitor I (100 μM, lanes 2 and 5) or MG132 proteasome inhibitor (40 μM, lanes 3 and 6). Ethanol, the solvent for calpain inhibitor I and MG132, was added to the cells as control (lanes 1 and 4). Endogenous (A) and transfected (B and C) IRF-3 proteins were detected in whole cell extracts (20 μg) by immunoblot.

Figure 9. IRF-3 interacts with CBP in virus infected cells.

(A) Schematic representation of CBP, illustrating the domains involved in interaction with host or viral proteins (modified from (28)) and the myc-tagged CBP proteins (CBP1, CBP2, CBP3) used for immunoprecipitation.

(B) 293 cells were transfected with wild type and deletion mutants of IRF-3 expression plasmid (5 μg, as indicated above the lanes) or left untransfected (lanes 1 and 8). At 24h after transfection, cells were infected with Sendai virus for 16h (lanes 1, 3-8, and 10-13) or left uninfected (lanes 1 and 9). Whole cell extracts (300 μg, except lane 1, which was 600 μg) were immunoprecipitated with anti-CBP antibody A22 (lanes 1-6)

or with preimmune serum (lane 7). The immunoprecipitated complexes (lanes 1-7) or 30 μg whole cell extracts (lanes 8-13) were run on 5% SDS-PAGE and subsequently probed with anti-IRF-3 antibody.

(C) 293 cells were co-transfected with myc-tagged CBP expression plasmids (as indicated above the lanes) and IRF-3 ΔN (Δ9-133) expression plasmid. At 24h after transfection, cells were infected with Sendai virus (lanes 2, 4 and 6) or left uninfected (lanes 1, 3 and 5). Whole cell extracts (300 μg) were immunoprecipitated with monoclonal anti-myc-tag antibody 9E10. The immunoprecipitated complexes were run on 5% SDS-PAGE and different forms of IRF-3 in the precipitates were analyzed by immunoblotting with anti-IRF-3 antibody.

(D) Whole cell extracts (30 μg) from (C) were also analyzed directly for the expression of myc-tagged CBP proteins by immunoblotting using anti-myc antibody 9E10.

Figure 10. The cDNA sequence encoding IRF-3(5D), together with the amino acid sequence of IRF-3(5D).

Figure 11. Transactivation study as described in Figure 6, using the IFNβ-CAT reporter plasmid to indicate the activity of various forms of IRF-3 and IRF-7 and binary mixtures thereof.

Figure 12. The cDNA sequence encoding IRF-7A(2D), together with the amino acid sequence of IRF-7A(2D).

Figure 13. The cDNA sequence encoding the IRF-7(1-246)/IRF-3(5D)(132-427) chimeric protein, together with the amino acid sequence of the IRF-7(1-246)/IRF-3(5D)(132-427) chimeric protein.

Figure 14. Transactivation study as described in Figure 6, using the IFNβ-CAT reporter plasmid to indicate the relative activity of various forms of IRF-3 and IRF-7, binary mixtures thereof and the chimeric protein IRF-7(1-246)/IRF-3(132-427) (IRF-7N-IRF-3(5D)C in Figure 14).

DETAILED DESCRIPTION OF THE INVENTION

As used herein, the term "nucleotide sequence" means a DNA or RNA molecule or sequence, and can include, for

example, a cDNA, genomic DNA, or synthetic DNA sequence, a structural gene or a fragment thereof, or an mRNA sequence, that encodes an active or functional polypeptide.

Two DNA, RNA or polypeptide sequences are "substantially homologous" or "structurally equivalent" when there is at least about 85% (preferably at least about 90%, more preferably at least about 95%) identity between the nucleotides or amino acids over a defined length of the molecule. DNA sequences that are substantially homologous can be identified in a Southern hybridization experiment under, for example, stringent conditions, as defined for that particular system. Appropriate hybridization conditions are within the knowledge of a person skilled in the art. See, for example, Maniatis et al., Molecular Cloning, A Laboratory Manual. Cold Spring Harbour Laboratory, New York (1982); Brown, T. A., Gene Cloning: An Introduction (2nd Ed.) Chapman & Hall, London (1990).

The results disclosed herein show that phosphorylation represents an important post-translational modification of IRF-3 leading to cytoplasmic-to-nuclear translocation of phosphorylated IRF-3, stimulation of DNA binding and transcriptional activity, association of IRF-3 with the transcriptional co-activator CBP/p300, and ultimately proteasome mediated degradation.

More specifically, the results disclosed herein show that, following Sendai virus infection, IRF-3 may be post-translationally modified by protein phosphorylation at multiple serine and threonine residues, located in the carboxy-terminus of IRF-3.

Furthermore, while modification of functionally relevant (phosphoacceptor) serine and threonine sites may be by phosphorylation, the modification may also be a mutation represented by replacement of at least one of these functionally relevant serine or threonine residues with an amino acid having a carboxylic acid in its side chain, preferably aspartic acid or glutamic acid, more preferably aspartic acid. The preferred mutant form of IRF-3 is that

having aspartic acid residues in at least one of positions 396, 398, 402, 404 and 405 of the sequence, more preferably in positions 396, 398, 402, 404 and 405 of the sequence (IRF-3(5D)) (Figure 10). The preferred mutant form of IRF-7 is that having asparatic acid residues in at least one of positions 477 and 479 of the sequence, more preferable in positions 477 and 479 of the sequence (IRF-7(2D)) (Figure 12).

Also within the scope of the invention are chimeric proteins comprising a carboxy-terminus domain of one modified IRF protein, modified as discussed above, and an amino-terminal domain of another IRF protein. Preferably, the amino-terminus of IRF-7 is fused to the carboxy-terminus of modified IRF-3. It is more preferred that the carboxy-terminus of modified IRF-3 is that of IRF-3(5D). Even more preferred is a chimeric protein comprising residues 1 to 246 of IRF-7 and residues 132 to 427 of IRF-3(5D) (Figure 13).

Also within the scope of the invention are proteins which are substantially homologous to the above proteins and which retain the function of those proteins. This includes proteins based on human IRF-3 and IRF-7, as well as corresponding IRF-3 and IRF-7 proteins of other species.

Nucleotide sequences within the scope of the invention are those which encode a protein of the invention. Preferably, the nucleotide sequence is a coding DNA sequence as defined in Figure 10 or a DNA sequence which is hybridizable under stringent conditions with the complement of the coding DNA sequence of Figure 10, which DNA encodes IRF-3(5D). Also, preferably, the nucleotide sequence is a coding DNA sequence as defined in Figure 12 or a DNA sequence which is hybridizable under stringent conditions with the complement of the coding DNA sequence in Figure 12, which DNA encodes IRF-7(2D). Also

preferably, the nucleotide sequence is a coding DNA sequence as defined in Figure 13 or a DNA sequence which is hybridizableunder stringent conditions with the complement of the coding DNA sequence of Figure 13, which DNA encodes IRF-7(1-246)/IRF-3 (132-427) chimeric protein.

A combination of IRF-3 deletion and point mutations localized the inducible phosphorylation sites to the region -ISNSHPLSLTSDQ- between amino acids 395 and 407; point mutation

of Ser-396 and Ser-398 residues eliminated virus-induced phosphorylation of IRF-3 protein, although residues Ser-402, Thr-404 and Ser-405 were also targets. Phosphorylation results in the cytoplasmic to nuclear translocation of IRF-3, DNA binding and increased transcriptional activation. Substitution of the Ser/Thr sites with the phosphomimetic Asp generated a constitutively active form of IRF-3 that functioned as a very strong activator of promoters containing PRDI/PRDIII or ISRE regulatory elements. Use of phosphomimetic Glu for this purpose is also possible. Phosphorylation also appears to represent a signal for virus mediated degradation, since the virus induced turnover of IRF-3 was prevented by mutation of the IRF-3 Ser/Thr cluster or by proteasome inhibitors.

Interestingly, virus infection resulted in the association of IRF-3 with the CBP coactivator, as detected by co-immunoprecipitation with anti-CBP antibody, an interaction mediated by the C-terminal domains of both proteins. Mutation of the residues Ser-396 and Ser-398 in IRF-3 abrogated its binding to CBP. These results are discussed in terms of a model in which virus-inducible C-terminal phosphorylation of IRF-3 alters protein conformation to permit nuclear translocation, association with transcriptional partners and primary activation of IFN- and IFN-responsive genes.

Sendai virus dependent phosphorylation of IRF-3 was detected, occurring in a cluster of Ser and Thr sites in the carboxyl-terminal end of the protein. The residues implicated in this regulatory phosphorylation event are Ser-396/Ser-398/Ser-402/Thr-404/Ser-405, particularly the Ser-396/Ser-398 amino acids. 2) Phosphorylation of the IRF-3 in the Ser-Thr cluster resulted in the cytoplasmic to nuclear translocation of IRF-3; nuclear translocation was blocked by mutation of the phosphorylated amino acids. 3) Sendai virus infection induced the DNA binding and transactivation potential of IRF-3. Furthermore, IRF-3 containing the phosphomimetic Asp at the sites of C-terminal phosphorylation was an exceptionally strong transactivator of PRDI/PRDIII and ISRE containing promoters. 4) Phosphorylation was also required for the

association of IRF-3 with the CBP co-activator protein. 5) Sendai virus infection resulted in IRF-3 degradation; again, phosphorylation was required as a signal for inducer mediated degradation since mutation of Ser/Thr cluster also blocked virus induced degradation.

Cytoplasmic to nuclear translocation of IRF-3 as a consequence of virus infection was inhibited by mutation of the Ser/Thr cluster, indicating an important regulatory role for C-terminal phosphorylation in the activation of IRF-3. Also strikingly, the conversion of the phosphorylation sites to the phosphomimetic Asp altered the subcellular localization of IRF-3 in uninfected cells. A proportion of IRF-3(5D) was localized to the nucleus of uninfected cells, suggesting that some IRF-3 may shuttle to and from the nucleus constitutively; this observation is consistent with the identification of a nuclear export signal in IRF-3. Mutation of L144A/L145A in the NES element produced the most impressive alterations in subcellular localization. In uninfected cells, IRF-3 was partitioned in both the nucleus and cytoplasm; virus infection changed the nuclear pattern of staining from extra-nucleolar homogeneous staining as observed for wtIRF-3 to an intense nuclear speckling. At this stage, the nature of the subnuclear changes in IRF-3 localization are not explained, although it is possible that IRF-3(NES) translocates efficiently into the nucleus but becomes trapped in the nuclear pore complex during the export process.

One of the striking results of the mutagenesis of the C-terminal domain of IRF-3 was the generation of IRF-3(5D), an exceptionally strong activator of IFN-β and ISG-15 gene expression. The phosphomimetic form of IRF-3 alone was able to stimulate IFN-β expression as strongly as virus infection, a level of stimulation not previously observed in co-expression experiments (24,61). In previous experiments, it has been demonstrated that IRF-3 was able to bind the ISRE element of ISG-15, as well as the PRDIII/PRDI and IE regions of the IFNB and IFNA promoters, respectively (2,56). Virus induction results in the appearance of two new protein-DNA complexes;

supershift experiments confirmed that both complexes contain IRF-3; it is not clear at this stage whether the upper complex also contains other proteins such as in the VIC (10,29) and DRAF (16) complexes or whether the lower complex represents a breakdown product of IRF-3. Strikingly, the same complexes appeared following co-transfection of IRF-3(5D) expression plasmid in the absence of virus induction, indicating that IRF-3(5D) represented a constitutive DNA binding form of IRF-3. Thus, in uninfected cells, IRF-3(5D) localized in part to the nucleus (Fig. 5), interacted with DNA constitutively and was a strong activator of gene expression (Fig. 6).

The recent crystal structure of the related IRF-1 protein bound to PRDI provides evidence for a novel helix-turn-helix motif that latches onto a GAAA core sequence via three of the five conserved tryptophan amino acids of the DNA binding domain (20). By analogy with IRF-3, two GAAANN sequences present in PRDIII of IFN-β and another GAAANN element present in PRDI may serve as DNA contacts for multiple IRF-3(5D) proteins with strong activating potential. Similarly, the ISRE element of the ISG-15 promoter also contains several GAAANN anchors for potential IRF binding. Given the range of promoters that possess this hexameric sequence (48), it will be of interest to determine the capacity of IRF-3(5D) to stimulate expression of different cytokine and chemokine genes.

IRF-3 joins a growing list of cellular and viral proteins that functionally interact with CBP/p300 proteins, highly homologous proteins originally identified through their interactions with adenovirus E1A and CREB proteins (1,13). As a critical determinant of its global transcriptional coactivator activity, CBP/p300 possesses histone acetyltransferase activity (5,50). Acetylation of histones is involved in the destabilization and remodelling of nucleosomes, a crucial step in permitting the accessibility of transcriptional factors to DNA templates. Several studies have now demonstrated that CBP/p300 participates in the transcriptional process by providing a scaffold for different

classes of transcriptional regulators on specific chromatin domains (12,50). A growing body of biochemical and genetic evidence also implicates CBP/p300 as a negative regulator of cell growth, based on its interactions with adenovirus E1a, SV40 large T antigen and the tumour suppressor p53, among others. With regard to p53-CBP/p300 complex formation, functional interaction between these two important growth regulatory proteins accounts for several of the known activities of p53 (3,28,40); interestingly, CBP/p300 was shown recently to acetylate p53 and stimulate its transactivation potential (27).

It will be of interest to determine whether IRF-3 is similarly modified by CBP association. The functional consequences of IRF-3 interaction with CBP/p300 remain to be elucidated, although recent studies demonstrated that CBP/p300 also functionally interacts with STAT 1 (68) and STAT 2 (7) and may contribute to IFNα and IFNγ nuclear signalling. Recently published studies have demonstrated that synergistic activation of the IFNβ promoter requires recruitment of CBP/p300 to the enhanceosome, via a new activating surface assembled from the activation domains of all the transcription factors in the enhanceosome (37,45). Alterations in any of the activation domains decreased both CBP recruitment and transcriptional synergy. By analogy, recruitment of CBP/p300 to DNA bound IRF-3 is likely required for maximal transcriptional activation. Association requires the interaction of the C-terminal domain of IRF-3 and the C-terminal interaction domain of CBP, a region previously shown to associate with the p53 tumour suppressor, whereas STAT1 and STAT2 associate with different regions of CBP (7,68).

Virus induced phosphorylation of IRF-3 also represents a signal for proteasome mediated degradation of IRF-3, since mutation of the Ser-396/Ser-398 or the use of proteasome inhibitors prevented the post infection degradation of IRF-3. Virus induced degradation of IRF-3 is reminiscent of the virus-induced turnover of another member of the IRF family - IRF-2. In response to dsRNA or viral induction, the 50 kD

IRF-2 protein is proteolytically processed into a smaller, 24-27 kDa protein (51) comprising the 160 aa DBD of IRF-2, termed TH3 (14) or In4 (65). Although TH3 has been shown to bind DNA and repress transcription more efficiently than the full length IRF-2 protein (42), its physiological role is not clear. Since the induction kinetics of TH3 are slower than that of IFN-β in response to dsRNA or viral infection (14), it has been suggested that the IRF-2 cleavage product may be a post-induction repressor of IFN-β gene expression (65).

Virus induced phosphorylation of IRF-3 at the C-terminal Ser/Thr residues and its subsequent degradation by a proteasome dependent pathway are also similar to the well studied phosphorylation and degradation of IκBα which leads to activation of NF-κB binding activity (reviewed in 4,6). In unstimulated cells, NF-κB heterodimers are retained in the cytoplasm by inhibitory IκB proteins. Upon stimulation by many activating agents, including cytokines, viruses and dsRNA, IκBα is rapidly phosphorylated and degraded, resulting in the release and nuclear translocation of NF-κB. The amino-terminus of IκBα represents a signal response domain for activation of NF-κB and substitution of alanine for either Ser-32 or Ser-36 completely abolished the signal-induced phosphorylation and degradation of IκBα, and blocked the activation of NF-κB. These mutations also blocked *in vitro* ubiquitination of the IκBα protein. The amino-terminus of IκBα is necessary for signal-induced phosphorylation and ubiquitination, but for degradation to occur, there is an absolute requirement for the C-terminal PEST domain (reviewed in 4,6).

Similarities and differences exist between the observed degradation of IRF-3 and the mechanism of IκBα degradation. The C-terminal phosphorylation of IRF-3 as a consequence of virus infection is required for its subsequent degradation based on the deletion and point mutation analysis of the region -ISNSHPLSLTSDQ- between amino acids 395 and 407. Minimally, phosphorylation of Ser-396 and Ser-398 are required for subsequent degradation, although Ser-402, Ser-404 and Ser-405 may represent secondary phosphorylation sites.

Likewise, in the case of IκBα, phosphorylation and Ser-32 and Ser-36 are required for inducer mediated degradation. Furthermore, the protease inhibitor calpain inhibitor I and the more specific proteasome inhibitor MG132 block IRF-3 turnover.

A major difference in the mechanisms of IκBα and IRF-3 turnover lies in the nature of the inducing stimuli. Multiple inducers - cytokines such as TNF and IL-1, viruses, LPS, oxidative stress, etc (6) - all lead to the induction of IκBα phosphorylation and degradation whereas IRF-3 phosphorylation appears to be induced only by virus infection and dsRNA addition; other inducers have not resulted in IRF-3 turnover.

A significant temporal difference also exists between IκBα phosphorylation/turnover and IRF-3 phosphorylation/degradation. Many activators of NF-κB stimulate IκBα phosphorylation within minutes and TNF induced degradation occurs within the first 15-30 minute after treatment. In the case of IRF-3, phosphorylation is not detected until 6-8 hours after infection and continues in a heterogenous manner over the next 10-12 hours. Previous experiments have, however, demonstrated that Sendai virus-induced turnover of IκBα also occurs slowly over several hours (24).

Based on the data presented herein and by analogy with the properties of other IRF family members (48), the following model is proposed to explain several observations. IRF-3 exists in a latent state in the cytoplasm of uninfected cells; the C-terminus may physically interact with the DNA binding domain in such a way as to obscure both the DBD and the IAD regions of the protein; the presence of an autoinhibitory domain within the C-terminal 20aa (407-427) would explain the activating effect of this deletion, as seen previously with IRF-4 (11,19). Virus induced phosphorylation at the Ser/Thr at 396-405aa cluster leads to a conformational change in IRF-3, exposing both the DBD and IAD and relieving C-terminal autoinhibition. Translocation to the nucleus, occurring via an

unidentified nuclear localization sequence or in conjunction with a transcriptional partner associating through the IAD region, leads to DNA binding at ISRE- and PRDI/PRDIII-containing promoters. Phosphorylation is also necessary for IRF-3 association with the chromatin remodelling activity of CBP/p300. The presence of a NES element ultimately shuttles IRF-3 from the nucleus and terminates the initial activation of IFN responsive promoters. The phosphorylated form of IRF-3 exported from the nucleus may now be susceptible to proteasome mediated degradation. This scenario shares several features with the protein synthesis independent activation of NF-κB, and further suggests that IRF-3 may represent a component of virus- or dsRNA-inducible complexes such as DRAF (16) or VIC (10,29) that could play a primary role in the induction of IFN- or IFN responsive genes.

In view of the above-mentioned properties, and in particular its ability to stimulate an immune response, IRF protein is useful as a tumour suppressor.

The invention is described in more detail in the following examples.

Example 1: Plasmid constructions and Mutagenesis.

The IRF-3 expression plasmid was prepared by cloning the *Eco*RI-*Xho*I fragment containing the IRF-3 cDNA from the pSKIRF-3 plasmid downstream of the CMV promoter of CMVBL vector. CMVt-IRF-3 was constructed by cloning of IRF-3 cDNA downstream of the doxycycline-responsive promoter CMVt at the *Bam*HI site of the neo CMVt BL vector (49). cDNAs encoding IRF-3 carboxyl terminal deletion mutations were generated by 28 cycles of PCR amplification with Vent DNA polymerase. DNA oligonucleotide primers were synthesized using an Applied Biosystems DNA/RNA synthesizer. The amino-terminal primer was synthesized with an *Eco*RI restriction enzyme site and the carboxyl-terminal primers were synthesized with *Xba*I restriction enzyme sites at their ends. The PCR products were purified by phenol/chloroform extraction and ethanol precipitation, digested with *Eco*RI and *Xba*I, and inserted into *Eco*RI/*Xba*I sites of CMVBL vector.

The point mutations of IRF-3 were generated by overlap PCR mutagenesis using Vent DNA polymerase. Mutations were confirmed by sequencing.

The N-terminal deletion mutations (ΔN, ΔN2A, ΔN3A and ΔN5A) of IRF-3 were generated by digestion of the related IRF-3/CMVBL plasmid with *Bam*HI (filled in with Klenow enzyme), partial digestion with *Sca*I, and re-ligation. GFP-IRF-3 expression plasmids were generated by cloning of cDNAs encoding wild type or mutated forms of IRF-3 into the downstream of EGFP in the pEGFP-C1 vector (Clonetech). For construction of plasmids encoding myc-tagged CBP truncated proteins, the cDNAs coding for CBP were generated from the pRC-RSV/mCBP plasmid (provided by Dr. Dimitris Thanos) by PCR amplification. The cDNA fragments were cloned in the downstream of myc-tag in 5' myc-PCDNA3 vector (provided by Dr. Stephane Richard).

For the construction of pFlag-IRF-7, the IRF-7 cDNA was created by PCR and the resulting product was cloned into pFlag CMV-2 vector. To generate the IRF-7(aa1-246)-IRF-3(5D) (aa132-427) chimera, the cDNA encoding IRF-3 (5D) (aa132-427) was cut out from IRF-3 (5D)/CMVBL plasmid with ScaI and NotI (blunted with Klenow enzyme) and was cloned into pFlag-IRF-7 (digested with SmaI, which removed the C-terminal region of IRF-7 from 247-503) in frame with the IRF-7 N-terminal amino acid sequence (1-246). The point mutations of IRF-7 (D477-D479) were generated by overlap PCR mutagenesis essentially as described above for IRF-3 using Vent DNA polymerase. Codon AGC encoding residues Ser 477 and Ser 479 were mutated to GAC (Asp). Mutations were confirmed by sequencing.

Example 2: <u>Generation of IRF-3 cell lines.</u>

Plasmid CMVt-rtTA (49) was introduced into 293 cells by a calcium phosphate-based method. Cells were selected beginning at 48h after transfection for about one week in αMEM media (GIBCO-BRL) containing 10% heat-inactivated calf serum, glutamine, antibiotics and 2.5 ng/μl puromycin (Sigma). Resistant cells carrying the CMVt-rtTA plasmid (rtTA-293 cells) were then transfected with the CMVt-IRF-3 plasmid. Cells were selected beginning at 48h for a period of approximately 2 weeks

in αMEM containing 10% heat-inactivated calf serum, glutamine, antibiotics, 2.5 ng/μl puromycin and 400 μg/ml G418 (Life Technologies, Inc.).

Example 3: Cell culture and transfections.

All transfections for CAT assay were carried out in human embryonic kidney 293 cells or NIH3T3 cells grown in αMEM (293) or Dulbecco's MEM (NIH3T3) media (GIBCO-BRL) supplemented with 10% calf serum, glutamine and antibiotics. Subconfluent cells were transfected with 5 μg of CsCl purified chloramphenicol acetyltransferase (CAT) reporter and expression plasmids by calcium phosphate coprecipitation method (293 cells) or lipofectamine (NIH3T3 cells). The reporter plasmids were the SVoβ CAT and ISG15 CAT reporter genes (56); also the transfection procedures were previously described (41,56). For individual transfections, 100 μg (SVoβ CAT) or 10 μg (ISG15 CAT) of total protein extract was assayed for 1-2h at 37°C. The CAT activity was normalized with β-Gal assay. All transfections were performed 3-6 times.

Example 4: Western blot analysis of IRF-3 modification and degradation.

To characterize the posttranslational regulation of IRF-3 protein, stable or transiently transfected IRF-3 expressing cells were infected with Sendai Virus (80 HAU/ml) or treated with 5 ng/ml TNF-α, either with or without addition of 50 μg/ml cycloheximide. In some experiments, cells were treated with either 100 μM calpain inhibitor I (ICN), 40 μM MG132 proteasome inhibitor, or an equivalent volume of their respective solvent (ethanol) as control. Cells were washed with phosphate-buffered saline and lysed in 10 mm Tris-Cl pH 8.0, 200 mm NaCl, 1 mm EDTA, 1 mm dithiothreitol (DTT), 0.5% Nonidet P-40 (NP-40), 0.5 mm phenylmethysulfonyl fluoride (PMSF), 5 μg/ml leupeptin, 5 μg/ml pepstatin, and 5 μg/ml aprotinin. Equivalent amounts of whole cell extract (20 μg) were subject to SDS-polyacrylamide gel electrophoresis (SDS-PAGE) in a 10% polyacrylamide gel. After electrophoresis, the proteins were transferred to Hybond transfer membrane (Amersham) in a buffer containing 30 mm This, 200 mm glycine

and 20% methanol for 1h. The membrane was blocked by incubation in phosphate-buffered saline (PBS) containing 5% dried milk for 1h and then probed with IRF-3 antibody in 5% milk/PBS, at a dilution of 1:3000. These incubations were done at 4°C overnight or at RT for 1-3h. After four 10 minute washes with PBS, membranes were reacted with a peroxidase-conjugated secondary goat anti-rabbit antibody (Amersham) at a dilution of 1:2500. The reaction was then visualized with the enhanced chemiluminescence detection system (ECL) as recommended by the manufacturer (Amersham Corp.).

Example 5: Phosphatase treatment.

Twenty to sixty μg of whole cell extract were treated with 0.3 units of potato acidic phosphatase (Sigma) in a final volume of 30 μl PIPES buffer (10 mm PIPES pH 6.0, 0.5 mm PMSF, 5 μg/ml aprotinin, 1 μg/ml leupeptin, and 1 μg/ml pepstatin) or 5 units of calf intestine alkaline phosphatase (Pharmacia) in 30 μl CIP buffer. The phosphatase inhibitor mix contained 10 mm NaF, 1.5 mm Na_2MoO_4, 1 mm β-glycerophosphate, 0.4 mm Na_3VO_4 and 0.1 μg/ml okadaic acid.

Example 6: Subcellular localization of GFP-IRF-3 proteins.

To analyse the subcellular localization of wild type and mutated forms of IRF-3 proteins in uninfected and virus infected cells, the GFP-IRF-3 expression plasmids (5 μg) were transiently transfected into COS-7 cells by the calcium phosphate coprecipitation method. For virus infection, transfected cells were infected with Sendai virus (80 hemagglutinating units per mL for 2h) at 24h post transfection. GFP fluorescence was analyzed in living cells with a Leica fluorescence microscope using a 40x objective.

Example 7: Electromobility Shift Assay.

Nuclear extracts were prepared from 293 cells at different times after infection with Sendai virus (80HAU/ml). In some experiments, extracts were prepared from cells transfected with different IRF-3 expression plasmids, as indicated in individual experiments. Cells were washed in Buffer A [10 mM HEPES, pH 7.9; 1.5 mm $MgCl_2$; 10 mM KCl; 0.5 mM dithiothreitol (DTT); and 0.5 mM phenylmethylsulfonyl fluoride

(PMSF)] and were resuspended in Buffer A containing 0.1% NP-40. Cells were then chilled on ice for 10 minutes before centrifugation at 10,000 g. Pellets were then resuspended in Buffer B (20mM HEPES, pH 7.9; 25% glycerol; 0.42 M NaCl; 1.5 mM $MgCl_2$; 0.2 mM EDTA; 0.5 mM DTT; 0.5 mM PMSF; 5 μg/ml leupeptin; 5 μg/ml pepstatin; 0.5 mM spermidine; 0.15 mM spermine; and 5 μg/ml aprotinin). Samples were incubated on ice for 15 minutes before being centrifuged at 10,000 g. Nuclear extract supernatants were diluted with Buffer C (20 mM HEPES, pH 7.9; 20% glycerol; 0.2 mM EDTA; 50 mM KCl; 0.5 mM DTT; and 0.5 mM PMSF). Nuclear extracts were subjected to EMSA by using a 32P-labelled probe corresponding to the PRDIII region of the IFN-β promoter (5'-GGAAAACTGAAAGGG-3') or the ISRE region of the ISG-15 promoter (5'-GATCGGGAAAGGGAAACCGAAACTGAAGCC-3'). The resulting protein-DNA complexes were resolved by 5% polyacrylamide gel and exposed to X-ray film. To demonstrate the specificity of protein-DNA complex formation, 125-fold molar excess of unlabelled oligonucleotide was added to the nuclear extract before adding labelled probe.

Example 8: Immunoprecipitation and Western analysis of CBP associated proteins.

Whole cell extract (300 μg) were prepared from either transfected or untransfected cells and precleared with 5 μl of preimmune rabbit serum and 20 μl of protein A-Sepharose beads (Pharmacia) for 1 hour at 4°C. The extract was incubated with 10 μl of anti-CBP antibody A-22 (Santa Cruz) or 2 μl anti-myc antibody 9E10 (21) and 30 μl of protein A-Sepharose beads for 2-3 hours at 4°C. Precipitates were washed 5 times with lysis buffer, eluted by boiling the beads 3 minutes in 1x SDS sample buffer. Eluted proteins were separated by SDS PAGE, transferred to Hybond transfer membrane. Membranes were incubated with anti-IRF-3 (1:3000) or anti-myc antibody 9E10 (1:1000). Immunocomplexes were detected by using a chemiluminescence-based system.

The results of the above examples are summarized below.

Virus induced phosphorylation of IRF-3 protein.

IRF-3 is expressed constitutively in various cells and its expression is not enhanced by viral infection or by IFN treatment. To investigate whether the IRF-3 protein is regulated by post-translational modification after virus infection, 293 cells were transiently transfected with an IRF-3 expression plasmid and subsequently infected with Sendai virus 24h later. In cells transfected with CMVBL vector alone, endogenous IRF-3 protein was easily detected using a polyclonal IRF-3 antibody and in cells transfected with the IRF-3 expression plasmid, IRF-3 protein levels were significantly increased (Fig.1, lanes 1 and 3). Interestingly, Sendai virus infection resulted in two alterations in the expression of IRF-3: 1) an overall decrease in the amount of IRF-3 in transfected and control cells (Fig. 1, lanes 2 and 4) and the generation of a more slowly migrating form of IRF-3 (Fig. 1, compare lanes 1 and 2). In all experiments, the turnover of IRF-3 after virus infection was more pronounced with the endogenous protein than with the transfected proteins (see Fig.1, as well as others). Because the transfected proteins were driven by the CMV promoter, ongoing synthesis of transfected IRF-3 may partially obscure the turnover of IRF-3.

The kinetics of virus-induced modification of IRF-3 were characterized in a 293 cell line that expressed IRF-3 inducibly under the control of the tetracycline responsive promoter CMVt (25,26). Infection of this cell line (designated rtTA-IRF-3) with Sendai virus resulted in a decrease in the amount of IRF-3 between 12 and 24h after infection (Fig. 2A). Two forms of IRF-3 protein (designated I and II) were detected in uninfected cells (Fig. 2A, lane 1) and following virus infection, a third slowly migrating form of IRF-3 was also detected (Fig.2A, lanes 4-7). To determine whether the slowest form of IRF-3 was due to virus-induced phosphorylation (P-IRF-3), the different forms of IRF-3 were subjected to treatment *in vitro* with potato acidic phosphatase (PPA) or calf intestine alkaline phosphatase (CIP) and/or phosphatase inhibitors (Fig. 2B). These treatments did not affect the

mobilities of forms I and II in uninfected cells (Fig. 2B, lanes 1-3). However, in rtTA-IRF-3 expressing 293 cells infected with Sendai virus for 12h, an additional slowly migrating, presumably phosphorylated form of IRF-3 was also detected (Fig. 2B, lane 6); this form of IRF-3 completely disappeared following CIP or PPA treatment (Fig.2B, lanes 6 and 7) but was maintained in the presence of CIP/PPA when phosphatase inhibitors were also added to the reaction (Fig. 2B, lanes 5 and 8).

Mapping the IRF-3 phosphorylation sites.

A series of deletions of IRF-3 were generated to identify the virus-induced phosphorylation site(s) of IRF-3 (Fig. 3A). 293 cells were transiently transfected with IRF-3 deletion mutants and the virus mediated phosphorylation was measured by immunoblotting (Fig. 3B). The results indicated that a virus-induced phosphorylation of IRF-3 occurs at the C-terminal end of IRF-3 since the mutations that contained only the N-terminal part of IRF-3 protein (133, 240, 328, 357 or 394aa) were not phosphorylated (Fig. 3B). Full length and 407aa forms of IRF-3 were phosphorylated as a consequence of virus infection (Fig. 3B, lanes 1-4). C-terminal truncation of IRF-3 to a protein of 394 or 357aa removed the site(s) of inducible phosphorylation (Fig. 3B, lanes 5-8), although the shortened versions of forms I and II were still observed. Also in the IRF-3 Δ9-133 mutation (ΔN) which had the DNA binding, N-terminal amino acids (aa9 to aa133) removed, both virus induced phosphorylation of IRF-3 and the differential migration of the shortened forms I and II were easily detected (Fig. 3B, lanes 9 and 10). Degradation of the endogenous forms of IRF-3 by virus infection was also detected in this experiment (compare Fig. 3B, lanes 7 and 9 with lanes 8 and 10).

Thus, by deletion analysis, a phosphorylation domain of IRF-3 protein was localized to the region -ISNSHPLSLTSDQ- between amino acids 395 and 407. Point mutations in the several putative Ser and Thr phosphorylation residues within this region were generated in the full length protein and the Δ9-133 (ΔN) protein (Fig. 4A). In the IRF-3 cDNA encoding

these proteins, the Ser-396/Ser398/Ser-402/Thr-404/Ser-405 residues were replaced by alanine (5A), as were the three residues Ser-402/Thr-404/Ser-405 (3A) and the two residues Ser-396/Ser-398 (2A). Transfection of these plasmids into 293 cells and subsequent virus infection revealed that full length wild type IRF-3 was phosphorylated (Fig. 4B, lanes 4 and 8), whereas the IRF-3 proteins containing 2A and 5A mutations were no longer phosphorylated in virus infected cells (Fig. 4B, lanes 6 and 10). Interestingly, IRF-3-3A was also very weakly phosphorylated as a consequence of virus infection, thus implicating Ser-402/Thr-404/Ser-405 as potential secondary sites of phosphorylation. Using the ΔN IRF-3 protein and the relevant point mutations, phosphorylation was detected with ΔN (Fig. 4B, lane 12) but not with ΔN-2A and ΔN-5A (Fig. 4B, lanes 14 and 18); likewise, ΔN-3A displayed very weak phosphorylation (Fig. 4B, lane 16).

These experiments thus implicate Ser-396 and Ser-398 as critical sites of virus-induced phosphorylation of IRF-3; however, Ser-402/Thr-404/Ser-405 residues also contribute to the observed phosphorylation, since the migration of phosphorylated ΔN-3A is significantly faster than ΔN and the phosphorylation level is decreased (Fig. 4B, lanes 12 and 16). Another study suggested the involvement of the Ser residues at aa385 and 386 as potential phosphoacceptor sites (67). However, in studies with the S385A/S386A mutation, no evidence was found for inducible phosphorylation at these sites. Nevertheless, since these sites represent consensus sites for CKI and CKII, constitutive phosphorylation is a possibility.

<u>IRF-3 phosphorylation induces cytoplasmic to nuclear translocation of IRF-3.</u>

Initial studies indicated that IRF-3 was localized in the cytoplasm of uninfected cells (67); to investigate the role of phosphorylation on IRF-3 localization, wild type and point mutated forms of IRF-3 were linked to green fluorescent protein (GFP), transfected into COS-7 cells and examined for Sendai virus induced changes in subcellular localization (Fig. 5). In uninfected cells, GFP-IRF-3 localized exclusively to the

cytoplasm; Sendai virus infection resulted in translocation of IRF-3 to the nucleus within 8h in 90-95% of the cells (Fig. 5A and B). Mutation of the Ser/Thr cluster in GFP-IRF-3(5A) completely abrogated virus-induced cytoplasmic to nuclear translocation (Fig. 5, C and D). Interestingly, the substitution of the Ser/Thr cluster with the phosphomimetic Asp in GFP-IRF-3(5D) likewise altered subcellular localization. IRF-3(5D) localized both to the nucleus and cytoplasm in uninfected cells (Fig. 5E), while virus infection resulted in an intense nuclear pattern of IRF-3(5D) fluorescence (Fig. 5F). Point mutation of a putative nuclear export signal in IRF-3, the L145A/L146A modification - termed IRF-3(NES) - also changed subcellular localization of IRF-3. In uninfected cells, GFP-IRF-3(NES) was localized to the nucleus and cytoplasm, with a homogeneous, extra-nucleolar pattern of nuclear staining. After virus infection, GFP-IRF-3(NES) localized to the nucleus with an intense speckled pattern of nuclear fluorescence in greater than 95% of the cells, suggesting that IRF-3(NES) may be trapped in the nucleus associated with the nuclear pore complex.

Transactivation of PRDI/PRDIII and ISRE promoters by IRF-3.

Next, the capacity of IRF-3 to regulate gene expression was analysed by transient transfection in human 293 and murine NIH3T3 cells using the IFNβ and ISG-15 promoters in reporter gene assays. Expression of NF-κB RelA(p65), IRF-1 and IRF-3 alone minimally induced IFNβ promoter activity between 3 to 4 fold (Fig. 6A and B), as shown previously (24,56,61). Introduction of the C-terminal point mutants - IRF-3(2A), IRF-3(3A) IRF-3(5A) - reduced the low transactivation capacity of IRF-3 to control levels (Fig. 6A). Interestingly, deletion of the C-terminal 20aa of IRF-3 to IRF-3(407) stimulated IFNβ activity about 6 fold, indicative of the removal of an inhibitory domain in IRF-3. However, further deletion to 394, 357 or 240 abrogated transactivation potential (Fig. 6A). Mutation of the NES element was not sufficient to stimulate IFNβ activity. Strikingly, the substitution of the Ser/Thr cluster at aa397-405 in IRF-3 with the phosphomimetic Asp

generated a very strong, constitutive transactivator protein that alone stimulated the IFNβ promoter 90 fold.

As shown previously, high level induction of the IFNβ promoter requires synergistic activation by NF-κB and IRF proteins (24,61). To analyse the properties of IRF-3 in synergistic activation of the IFNβ promoter, co-expression studies were performed using RelA(p65) expression plasmid and different wild type and mutant forms of IRF-3 (Fig. 6B). Co-expression of RelA and IRF-1 or RelA and IRF-3 stimulated IFNβ-CAT activity by 20-25 fold. IRF-3(407) and RelA(p65) stimulated IFNβ activity about 40 fold, supporting the idea of the removal of an inhibitory domain in IRF-3, whereas both the IRF-3(394) and the IRF-3(NES) failed to synergise with RelA in the activation of the IFNβ promoter. RelA and IRF-3(NES) produced a relatively weak 8 fold induction of IFNβ expression, indicating that nuclear localization is not sufficient for IRF-3 activation. The combination of RelA and IRF-3(5D) produced an 80 fold stimulation of IFNβ promoter activity (Fig. 6B); together with the above data, IRF-3(5D) alone appears to be capable of full stimulation of the IFNβ promoter and further synergy with RelA is not observed (compare Fig. 6A and B). Surprisingly, IRF-3(5A) and RelA produced a 30 fold stimulation, suggesting that 5A can still synergise with RelA, despite mutation of the Ser/Thr cluster.

The transactivation potential of IRF-3 was also analysed using the ISG-15 promoter, an ISRE containing regulatory element (Fig. 6C). As shown previously (2), and above for the IFNβ promoter, IRF-3 alone weakly activated the ISG-15 promoter; in the context of this regulatory element, IRF-3 was weaker than IRF-1, which produced a 9 fold stimulation. Again deletion of the C-terminal 20aa of IRF-3 generated a protein that stimulated gene expression; with the ISG-15 promoter, a 12 fold induction was observed; IRF-3(394) and IRF-3(357) did not stimulate gene expression but rather slightly repressed ISG-15. Again remarkably, IRF-3(5D) produced a 50 fold induction of the ISG-15 promoter (Fig. 6C), thus demonstrating that substitution of the Ser/Thr sites with

the phosphomimetic Asp generated a constitutively active form of IRF-3 that functioned as a very strong activator of promoters containing PRDI/PRDIII or ISRE regulatory elements.

Activation of RANTES Transcription by IRF-3 and Virus

Chemokine expression is demonstrated in Figure 7, the chemokine being RANTES (Regulated on Activation Normal T-cell Expressed and Secreted) protein. IRF-3-inducible cells were used to determine whether other cytokine-chemokine genes may be regulated by IRF-3; an (Rnase Protection Analysis (RPA) with multiple human cytokine-chemokine probes (Pharmingen) was used to examine RNA derived from rtTA-IRF-3 or rtTA-IRF-3(5D) cells. Strikingly, the RANTES gene was highly expressed in the IRF-3(5D)-inducible cells, as well as in virus-infected cells (Fig. 7A, lanes 3, 5, and 7) but not in uninfected rtTA- or wt IRF-3-expressing cells (Fig. 7A, lanes 1 and 4). Since IRF-3(5D) was a strong transactivator of the IFN-β promoter in transient transfection assays, the possibility of an autoregulatory effect of IFN-α/β expression on transcription of RANTES promoter via JAK-STAT activation was considered. Activation of RANTES did not occur secondary to the production of IFN-α/β, since RANTES mRNA was not detected in control rtTA-expressing cells treated directly with IFN-α/β (Fig. 7A, lane 2); furthermore, addition of neuralizing antibody directed against type I IFN did not block the stimulation of RANTES gene expression by IRF-3(5D) (Fig. 7A, lane 8). Other experiments also demonstraed that IRF-3 itself was not activated by IFN treatment (13a). Inducible expression of RANTES in cells stably expressing a dominant-negative form of IRF-3 which lacks the N-terminal amino acids 9 to 133 and does not bind to DNA was also examined. As shown in Fig. 7B, RANTES gene transcription was indcued by Sendai virus in control (rtTA) cells (Fig. 7B) but not in IRF-3 (ΔN)-expressing cells (Fig. 7B). This experiment indicates that a non-DNA binding, dominant-negative mutant of IRF-3 is able to block completely virus-induced activation of RANTES transcription.

The kinetics of IRF-3 transgene induction and RANTES mRNA expression were characterized at various times following

Dox induction. IRF-3(5D) was detected at 8 to 12 hours with peak levels at 24 hours following Dox addition. RANTES mRNA was first detectable at 18 hours after Dox induction with peak levels at 40 hours (Fig. 7C, lanes 5 to 10). Induction of RANTES protein expression as detected by ELISA (Fig. 7D) was first observed at 12 hours after Dox induction of IRF-3, in good agreement with the mRNA levels, and accumulated thereafter with a dramatic increase between 24 and 32 hours after stimulation, also in agreement with mRNA levels. The possibility that IRF-3(5D) may be directly activating another transcription factor such as NF-κB, which in turn would stimulte RANTES transciption, was also considered. No evidence for IRF-3(5D)-mediated activation of NF-κB DNA binding activigy was observed. Similarly, IRF-3(5D) expression did not activate the human immunodeficiency virus (HIV)-long terminal repeat, a complex promoter controlled by NF-κB and other transcription factors (data not shown).

Inhibition of IRF-3 degradation.

Another consequence of virus infection is the degradation of the IRF-3. Since phosphorylation of proteins is functionally associated with the process of protein degradation via the ubiquitin-dependent proteasome pathway (53,57,60), the effect of proteasome inhibitors on virus-induced turnover of IRF-3 was examined. In cells transfected with the ΔN and ΔN5A forms of IRF-3, virus induced degradation of full length (endogenous) forms of IRF-3 (Fig. 8A, lanes 1 and 4) and the truncated ΔN (Fig. 8B, lanes 1 and 4) was detected. Addition of the protease inhibitor calpain inhibitor I or the proteasome inhibitor MG132 blocked virus-induced IRF-3 degradation (Fig. 8A and 8B, lanes 4-6). Particularly with the ΔN protein, the accumulation of the phosphorylated form of ΔN was also detected in virus infected cells (Fig. 8B, lanes 5 and 6), suggesting that phosphorylation of IRF-3 may represent a signal for subsequent degradation by the proteasome pathway. To confirm this idea, the 5A point mutated form of IRF-3 was analysed; the IRF-3-ΔN5A protein was resistant to virus induced degradation (Fig. 8C, lanes 1 and 4); no further stabilization of

IRF-3-ΔN5A occurred with calpain inhibitor I or MG132 addition and no phosphorylated IRF-3 was detected (Fig. 8C, lanes 4-6). These experiments demonstrate that virus dependent phosphorylation of the C-terminal of IRF-3 represents a signal for subsequent proteasome mediated degradation.

Interaction between IRF-3 and CBP in virus infected cells.

To examine the possibility that IRF-3 associated with the co-activator CBP/p300 (Fig. 9A) following Sendai virus infection, CBP was immunoprecipitated from virus-infected cells with anti-CBP antibody; an immunoblot for IRF-3 revealed that IRF-3 was co-precipitated from virus-infected cells but not from uninfected cells (Fig. 9B, lanes 2 and 3). This interaction was observed clearly in cells co-transfected with the IRF-3 expression plasmid (Fig. 9B, lane 3) but was not seen when the immunoprecipitation was performed with pre-immune serum (Fig. 9B, lane 7). The endogenous IRF-3 also co-precipitated from virus-infected cells (Fig. 9B, lane 1). However, mutation of the Ser/Thr residues identified as the virus inducible phosphorylation sites abrogated the association of IRF-3 with CBP. In particular, IRF-3(2A) and IRF-3(5A) were detected in whole cell extract immunoblot but not in the CBP immunoprecipitate (Fig. 9B, compare lanes 4 and 6 with lanes 11 and 13). With the IRF-3(3A) mutant, interaction with CBP was still observed (Fig. 9B, lane 5). The high background in all lanes represents secondary antibody reactivity with rabbit IgG from the immunoprecipitation. Immunoblot analysis of the whole cell extracts revealed that phosphorylated IRF-3, as well as forms I and II were present in virus infected cells (Fig. 9B, lane 10) and in cells transfected with 2A, 3A and 5A the forms I and II were observed but not the phosphorylated form of IRF-3 (Fig. 9B, lanes 11-13).

CBP has several domains that bind transcription factors, designated CBP1, CBP2, and CBP3 respectively (Fig. 9A, reviewed in (28)). To determine which domain of CBP interacts with IRF-3, the three specific subdomains were myc-tagged at the 5′ end by subcloning into the pCDNA3 vector (Fig. 9A). 293 cells were co-transfected with these myc-tagged CBP expression

plasmids together with the IRF-3 ΔN (Δ9-133) expression plasmid. At 24h after transfection, cells were infected with Sendai virus, co-immunopreciptated with anti-myc antibody 16h later (21) and then immunoblotted for IRF-3. Endogenous IRF-3 and transfected IRF-3 ΔN proteins co-precipitated with CBP-3 from virus-infected cells but not from uninfected cells (Fig. 9C, lane 6). In cells co-transfected with CBP-1 and CBP-2, no endogenous or transfected ΔN IRF-3 was detected (Fig. 9C, lanes 1-4). Immunoblot analysis of the whole cell extracts revealed that all three myc-tagged CBP proteins were efficiently expressed in uninfected and virus infected cells (Fig. 9D). These results demonstrate that IRF-3 binds to the C-terminal domain of CBP in virus infected cells and interaction with CBP requires Ser-396/Ser-398 phosphorylation of IRF-3 but not at Ser-402/Thr-404/Ser-405.

Figure 11 shows the relative activity of various forms of IRF-3 and IRF-7, and binary mixtures thereof, in transactivation studies. Both the IRF-3(5D) and IRF-7(2D) mutants show increased activity relative to their corresponding wild-type proteins. There is a synegistic effect present when both proteins are present, and this effect is most pronounced in a mixture of the IRF-3(5D) and IRF-7(2D) (D477/479) mutants.

Figure 14 shows that the chimeric protein IRF-7(1-246)/IRF-3(5D)(132-427) has a markedly increased activity over the mixture of the IRF-3(5D) and IRF-7(2D) (D477/479) mutants.

A pharmaceutical composition may be prepared, with a protein of the invention as active ingredient, for the treatment of a viral infection, such as an influenza infection, a herpes infection or an HIV infection.

The pharmaceutical compositions of the present invention may be formulated in a conventional manner using one or more pharmaceutically acceptable carriers. Thus, the active compounds of the invention may be formulated for oral, buccal, transdermal (e.g., patch), intranasal, parenteral (e.g., intravenous, intramuscular or subcutaneous) or rectal

administration or in a form suitable for administration by inhalation or insufflation.

For oral administration, the pharmaceutical compositions may take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (e.g. pregelatinised maize starch, polyvinylpyrrolidone or hydroxypropyl methylcellulose); fillers (e.g., lactose, microcrystalline cellulose or calcium phosphate); lubricants (e.g., magnesium stearate, talc or silica); disintegrants (e.g., potato starch or sodium starch glycollate); or wetting agents (e.g., sodium lauryl sulphate). The tablets may be coated by methods well known in the art. Liquid preparations for oral administration may take the form of, for example, solutions, syrups or suspensions, or they may be presented as a dry product for constitution with water or other suitable vehicle before use. Such liquid preparations may be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (e.g., sorbitol syrup, methyl cellulose or hydrogenated edible fats); emulsifying agents (e.g., lecithin or acacia); non-aqueous vehicles (e.g., almond oil, oily esters or ethyl alcohol); and preservatives (e.g., methyl or propyl p-hydroxybenzoates or sorbic acid).

For buccal administration the composition may take the form of tablets or lozenges formulated in conventional manner.

The active compounds of the invention may be formulated for parenteral administration by injection, including using conventional catherization techniques or infusion. Formulations for injection may be presented in unit dosage form, e.g., in ampules or in multi-dose containers, with an added preservative. The compositions may take such forms as suspensions, solutions or emulsions in oily or aqueous vehicles, and may contain formulating agents such as suspending, stabilizing and/or dispersing agents. Alternatively, the active ingredient may be in powder form for

reconstitution with a suitable vehicle, e.g., sterile pyrogen-free water, before use.

The active compounds of the invention may also be formulated in rectal compositions such as suppositories or retention enemas, e.g., containing conventional suppository bases such as cocoa butter or other glycerides.

For intranasal administration or administration by inhalation, the active compounds of the invention are conveniently delivered in the form of a solution or suspension from a pump spray container that is squeezed or pumped by the patient or as an aerosol spray presentation from a pressurized container or a nebulizer, with the use of a suitable propellant, e.g., dichlorodifluoromethane, trichlorofluoromethane, dichlorotetrafluoroethane, carbon dioxide or other suitable gas. In the case of a pressurized aerosol, the dosage unit may be determined by providing a valve to deliver a metered amount. The pressurized container or nebulizer may contain a solution or suspension of the active compound. Capsules and cartridges (made, for example, from gelatin) for use in an inhaler or insufflator may be formulated containing a powder mix of a compound of the invention and a suitable powder base such as lactose or starch.

The protein of the invention can also be made available using gene therapy. The DNA encoding the protein can be introduced to cells of an organism at a target site, for example, by a viral vector, by electroporation, by co-transfection with a selectable marker, or by DNA vaccine.

CLAIMS:

1. A modified interferon regulatory factor (IRF) protein, the protein comprising at least one modified serine or threonine phosphoacceptor site in the carboxy-terminus domain, with the proviso that where said IRF protein is IRF-3, said at least one modified phosphoacceptor site does not comprise Ser-385 or Ser-386.

2. The interferon regulatory factor (IRF) protein according to claim 1, wherein cytokine gene activation by the modified IRF is increased relative to cytokine gene activation by a corresponding wild type IRF protein.

3. The interferon regulatory factor (IRF) protein according to claim 1 or 2, wherein the modified IRF is an IRF-3 protein modified at at least one serine or threonine phosphoacceptor site.

4. The interferon regulatory factor (IRF) protein according to claim 1 or 2, wherein the modified IRF is an IRF-7 protein modified at at least one serine or threonine phosphoacceptor site.

5. The interferon regulatory factor (IRF) protein according to any one of claims 1 to 4, wherein the at least one modified phosphoacceptor site is modified by phosphorylation.

6. The interferon regulatory factor (IRF) protein according to any one of claims 1 to 4, wherein the at least one modified phosphoacceptor site comprises an amino acid residue having an acidic side chain.

7. The interferon regulatory factor (IRF) protein according to claim 6, wherein the amino acid residue is aspartic acid.

8. The interferon regulatory factor (IRF) protein according to claim 5, wherein the modified IRF is IRF-3 modified at a site selected from at least one of Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405.

9. The interferon regulatory factor (IRF) protein according to claim 8, wherein the modified IRF is IRF-3 modified at Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405 sites.

10. The interferon regulatory factor (IRF) protein according to claim 9, wherein the modified IRF comprises a carboxy-terminus domain of Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405 and an amino-terminus domain from IRF-7.

11. The interferon regulatory factor (IRF) protein according to claim 6 or 7, wherein the modified IRF is IRF-3

modified at a site selected from at least one of Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405.

12. The interferon regulatory factor (IRF) protein according to claim 11, wherein the modified IRF is IRF-3 modified at Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405 sites.

13. The interferon regulatory factor (IRF) protein according to claim 12 having SEQ ID NO. 2 (IRF-3 (5D)).

14. The interferon regulatory factor (IRF) protein according to claim 12, wherein the modified IRF comprises a carboxy-terminus domain of Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405 and an amino-terminus domain from IRF-7.

15. The interferon regulatory factor (IRF) protein according to claim 14, wherein the modified IRF has an amino-terminal domain comprising residues 1 to 246 of IRF-7 and a carboxy-terminal domain comprising residues 132 to 427 of IRF-3 modified by replacement each of Ser-396, Ser-398, Ser-402, Thr-404 and Ser-405 by an aspartic acid residue.

16. The interferon regulatory factor (IRF) protein according to claim 15 having SEQ ID NO. 11 (IRF-7(1-246)/ IRF-3(5D)(132-427)).

17. The interferon regulatory factor (IRF) protein according to claim 5, wherein the modified IRF is IRF-7 modified at a site selected from at least one of Ser-477 and Ser-479.

18. The interferon regulatory factor (IRF) protein according to claim 17, wherein the modified IRF-7 is modified at Ser-477 and Ser-479 sites.

19. The interferon regulatory factor (IRF) protein according to claims 6 or 7, wherein the modified IRF is IRF-7 modified at a site selected from at least one of Ser-477 and Ser-479.

20. The interferon regulatory factor (IRF) protein according to claim 19, wherein the modified IRF-7 is modified at Ser-477 and Ser-479 sites.

21. The interferon regulatory factor (IRF) protein according to claim 20 having SEQ ID NO. 9 (IRF-7(2D)).

22. A nucleotide sequence selected from:

(a) a first nucleotide sequence which encodes the interferon regulatory factor (IRF) protein according to any one of claims 6, 7, 11 to 16, 19, 20 or 21, or

(b) a second nucleotide sequence that is hybridizable under stringent conditions with the complement of the first nucleotide sequence, wherein said second nucleotide sequence encodes an IRF protein wherein at least one serine or threonine phosphoacceptor site comprises an amino acid residue having an acidic side chain.

23. The nucleotide sequence according to claim 22, having SEQ ID NO. 1.

24. The nucleotide sequence according to claim 22, having SEQ ID NO. 8.

25. The nucleotide sequence according to claim 22, having SEQ ID NO. 10.

26. A pharmaceutical composition comprising an effective amount of the interferon regulatory factor (IRF) protein according to any one of claims 1 to 21, together with a pharmaceutically acceptable carrier, for the treatment of a viral infection.

27. The pharmaceutical composition according to claim 26, wherein the viral infection is selected from an influenza infection, a herpes infection, a hepatitis infection and an HIV infection.

28. Use of the interferon regulatory factor (IRF) protein according to any one of claims 1 to 21 to activate a cytokine gene.

29. The use according to claim 28, wherein the cytokine gene is an interferon gene or a chemokine gene.

30. Use of the interferon regulatory factor (IRF) protein according to any one of claims 1 to 21 in cancer treatment.

31. Use of the nucleotide sequence according to any one of claims 22 to 25 to modify a target cell of an organism.

32. A commercial package containing as an active pharmaceutical ingredient the pharmaceutical composition according to claim 26 together with instructions for its use for the treatment of a viral infection.

33. The commercial package according to claim 32, wherein the viral infection is selected from an influenza infection, a herpes infection, a hepatitis infection and an HIV infection.

34. A commercial package containing as an active pharmaceutical ingredient the interferon regulatory factor (IRF) protein according to any one of claims 1 to 21 together with instructions for its use for the treatment of cancer.

FIG. 14

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

COMBINED DECLARATION AND POWER OF ATTORNEY

As a below named inventor, I hereby declare that: my residence, post office address and citizenship are as stated below next to my name; that I verily believe that I am the original, first and sole inventor (if only one name is listed below) or a joint inventor (if plural inventors are named below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

HIGHLY ACTIVE FORMS OF INTERFERON REGULATORY FACTOR PROTEINS

the specification of which

(check one) ☐ is attached hereto.

☒ was filed on October 6, 2000

as U.S. Application Serial No. 09/647,965

☐ was filed on _____

as PCT International Application No. _____

and (if applicable) was amended on _____

I hereby state that I have reviewed and understand the contents of the above identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information known to me which is material to the examination of this application in accordance with Title 37, Code of Federal Regulations, §§1.56(a) and (b), which state:

"(a) A patent by its very nature is affected with a public interest. The public interest is best served, and the most effective patent examination occurs when, at the time an application is being examined, the Office is aware of and evaluates the teachings of all information material to patentability. Each individual associated with the filing and prosecution of a patent application has a duty of candor and good faith in dealing with the Office, which includes a duty to disclose to the Office all information known to that individual to be material to patentability as defined in this section. The duty to disclose information exists with respect to each pending claim until the claim is cancelled or withdrawn from consideration, or the application becomes abandoned. Information material to the patentability that is cancelled or withdrawn from consideration need not be submitted if the information is not material to the patentability of any claim remaining under consideration in the application. There is no duty to submit information which is not material to the patentability of any existing claim. The duty to disclose all information known to be material to patentability is deemed to be satisfied if all information known to be material to patentability of any claim issued in a patent was cited by the Office or submitted to the Office in the manner prescribed by §§1.97(b)-(d) and 1.98. However, no patent will be granted on an application in connection with which fraud on the Office was practiced or attempted or the duty of disclosure was violated through bad faith or intentional misconduct. The Office encourages applicants to carefully examine:

(1) prior art cited in search reports of a foreign patent office in a counterpart application,

(2) the closest information over which individuals associated with the filing or prosecution of a patent application believe any pending claim patentably defines, to make sure that any material information contained therein is disclosed to the Office.

(b) Under this section, information is material to patentability when it is not cumulative to information already of record or being made of record in the application, and

(1) It establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or
(2) It refutes, or is inconsistent with, a position the applicant takes in:
  (i) Opposing an argument of unpatentability relied on by the Office, or
  (ii) Asserting an argument of patentability.

A prima facie case of unpatentability is established when the information compels a conclusion that a claim is unpatentable under the preponderance of evidence, burden-of-proof standard, giving each term in the claim its broadest reasonable construction consistent with the specification, and before any consideration is given to evidence which may be submitted in an attempt to establish a contrary conclusion of patentability."

I hereby claim foreign priority benefits under 35 United States Code, §119 and/or §365 of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate filed by me or my assignee disclosing the subject matter claimed in this application and having a filing date (1) before that of the application on which priority is claimed, or (2) if no priority claimed, before the filing of this application:

PRIOR FOREIGN APPLICATION(S)

Number	Country	Filing Date *(Month/Day/Year)*	Date First Laid-open or Published	Date Patented or Granted	Priority Claimed?
2234588	CA	04/07/98			

I hereby claim the benefit under 35 United States Code, §119(e) of any United States provisional application(s) listed below:

Application Number	Filing Date

I hereby claim the benefit under Title 35, United States Code, §120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, §112, I acknowledge the duty to disclose information which is material to patentability as defined in Title 37, Code of Federal Regulations, §1.56(a) which became available between the filing date of the prior application and the national or PCT international filing date of this application:

PRIOR U.S. OR PCT APPLICATION(S)

Application No.	Filing Date *(month/day/year)*	Status *(pending, abandoned, granted)*
PCT/CA99/00314	04/07/99	PENDING

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that wilful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such wilful false statements may jeopardize the validity of the application or any patent issued thereon.
I hereby appoint the following patent agents with full power of substitution, association and revocation to prosecute this application and/or international application and to transact all business in the Patent and Trademark Office connected therewith:

VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY STATUS (37 CFR 1.9(f) AND 1.27 (b)) - INDEPENDENT INVENTOR

Docket No. 76023-36

Serial No.	Filing Date	Patent No.	Issue Date
09/647,965	10.06.00		

Applicant/ Patentee: **HISCOTT, John and LIN, Rongtuan**

Invention:

HIGHLY ACTIVE FORMS OF INTERFERON REGULATORY FACTOR PROTEINS

As a below named inventor, I hereby declare that I qualify as an independent inventor as defined in 37 CFR 1.9(c) for purposes of paying reduced fees under section 41(a) and (b) of Title 35, United States Code, to the Patent and Trademark Office with regard to the invention entitled above and described in:

- ☐ the specification to be filed herewith.
- ☒ the application identified above.
- ☐ the patent identified above.

I have not assigned, granted, conveyed or licensed and am under no obligation under contract or law to assign, grant, convey or license, any rights in the invention to any person who could not be classified as an independent inventor under 37 CFR 1.9(c) if that person had made the invention, or to any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a nonprofit organization under 37 CFR 1.9(e).

Each person, concern or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

- ☐ No such person, concern or organization exists.
- ☒ Each such person, concern or organization is listed below.

*NOTE: Separate verified statements are required from each named person, concern or organization having rights to the invention averring to their status as small entities (37 CFR 1.27)

FULL NAME **SIR MORTIMER B. DAVIS - JEWISH GENERAL HOSPITAL**
ADDRESS **3755 Chemin de la Côte-Ste-Catherine, Montreal, Quebec, H3T 1E2**

I acknowledge the duty to file, in this application or patent, notification of any change in status resulting in loss of entitlement to small entity status prior to paying, or at the time of paying, the earliest of the issue fee or any maintenance fee due after the date on which status as a small entity is no longer appropriate. (37 CFR 1.28(b))

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code, and that such willful false statements may jeopardize the validity of the application, any patent issuing thereon, or any patent to which this verified statement is directed.

VERIFIED STATEMENT (DECLARATION) CLAIMING SMALL ENTITY STATUS (37 CFR 1.9(f) AND 1.27 (d)) - NONPROFIT ORGANIZATION

Docket No. 76023-36

Serial No.	Filing Date	Patent No.	Issue Date
09/647,965	10/06/00		

Applicant/
Patentee: **HISCOTT, John and LIN, Rongtuan**

Invention:

HIGHLY ACTIVE FORMS OF INTERFERON REGULATORY FACTOR PROTEINS

I hereby declare that I am an official empowered to act on behalf of the nonprofit organization identified below:

NAME OF ORGANIZATION: **SIR MORTIMER B. DAVIS - JEWISH GENERAL HOSPITAL**

ADDRESS OF ORGANIZATION: **3755 Chemin de la Cote-Ste-Catherine**
Montreal, Quebec
H3T 1E2 Canada

TYPE OF NONPROFIT ORGANIZATION:

- ☐ University or other Institute of Higher Education
- ☐ Tax Exempt under Internal Revenue Service Code (26 U.S.C. 501(a) and 501(c)(3))
- ☐ Nonprofit Scientific or Educational under Statute of State of The United States of America
  Name of State: Citation of Statute:
- ☐ Would Qualify as Tax Exempt under Internal Revenue Service Code (26 U.S.C. 501(a) and 501(c)(3)) if Located in The United States of America
- ☒ Would Qualify as Nonprofit Scientific or Educational under Statute of State of The United States of America if Located in The United States of America
  Name of State: Citation of Statute:

I hereby declare that the above-identified nonprofit organization qualifies as a nonprofit organization as defined in 37 C.F.R. 1.9(e) for purposes of paying reduced fees to the United States Patent and Trademark Office regarding the invention described in:

- ☐ the specification to be filed herewith.
- ☒ the application identified above.
- ☐ the patent identified above.

I hereby declare that rights under contract or law have been conveyed to and remain with the nonprofit organization with regard to the above identified invention.

If the rights held by the above-identified nonprofit organization are not exclusive, each individual, concern or organization having rights to the invention is listed on the next page and no rights to the invention are held by any person, other than the inventor, who could not qualify as an independent inventor under 37 CFR 1.9(c) or by any concern which would not qualify as a small business concern under 37 CFR 1.9(d) or a nonprofit organization under 37 CFR 1.9(e).

Each person, concern or organization to which I have assigned, granted, conveyed, or licensed or am under an obligation under contract or law to assign, grant, convey, or license any rights in the invention is listed below:

☒ no such person, concern or organization exists.
☐ each such person, concern or organization is listed below.
